Question **1**
Correct
Marked out of 3.00
☐ Flag question

Objective

This is a simple challenge to help you practice printing to stdout.

We're starting out by printing the most famous computing phrase of all time! In the editor below, either printf or cout to print the string **Hello, World!** to stdout.

Input Format

You do not need to read any input in this challenge.

Output Format

Print **Hello, World!** to stdout.

Sample Output

Hello, World!

Answer: (penalty regime: 0 %)

```
#include<stdio.h>
int main(){
printf("Hello, World!");
}
```

	Expected	Got	
	Hello, World!	Hello, World!	

Passed all tests!

Question **2**
Correct

Objective

question

To take a single character **ch** as input, you can use `scanf("%c", &ch);` and `printf("%c", ch)` writes a character to the argument `ch` to `stdout`:

```
char ch;
scanf("%c", &ch);
printf("%c", ch);
```

This piece of code prints the character **ch**.

Task

You have to print the character, **ch**.

Input Format

Take a character, **ch** as input.

Output Format

Print the character, **ch**.

Answer: (penalty regime: 0 %)

```
#include<stdio.h>
int main() {
    char ch;
    scanf("%c",&ch);
    printf("%c",ch);
}
```

	Input	Expected	Got	
	C	C	C	

Passed all tests!

Question **3**

Correct

Marked out of 7.00

☐ Flag question

Objective

The fundamental data types in c are int, float and char. Today, we're discussing int and float data types.

The `printf()` function prints the given statement to the console. The syntax is `printf("format string", argument)`, if we are using an integer, character, string or float as argument, then in the format string write `%d` (integer), `%c` (character), `%s` (string), `%f` (float) respectively.

variable **number**.

To input two integers separated by a space on a single line, the command is `scanf("%d %d", &n, &` the two integers.

Task

Your task is to take two numbers of **int data type**, two numbers of float data type as input and out

1. Declare **4** variables: two of type int and two of type float.
2. Read **2** lines of input from stdin (according to the sequence given in the 'Input Format' section) your **4** variables.
3. Use the **+** and **-** operator to perform the following operations:
 - o Print the sum and difference of two int variable on a new line.
 - o Print the sum and difference of two float variable rounded to one decimal place on a new line.

Input Format

The first line contains two integers.

The second line contains two floating point numbers.

Constraints

- **$1 \leq \text{integer variables} \leq 10^4$**
- **$1 \leq \text{float variables} \leq 10^4$**

Output Format

Print the sum and difference of both integers separated by a space on the first line, and the sum a float (scaled to **1** decimal place) separated by a space on the second line.

Sample Input

```
10 4
4.0 2.0
```

Sample Output

```
14 6
6.0 2.0
```

Explanation

When we sum the integers **10** and **4**, we get the integer **14**. When we subtract the second number **10**, we get **6** as their difference.

When we sum the floating-point numbers **4.0** and **2.0**, we get **6.0**. When we subtract the second number **4.0**, we get **2.0** as their difference.

Answer: (penalty regime: 0 %)

REC-CIS

```
#include<stdio.h>
int main() {
    int a,b;
    float c,d;
    scanf("%d%d",&a,&b);
    scanf("%f%f",&c,&d);
    printf("%d ",a+b);
    printf("%d\n",a-b);
    printf("%.1f ",c+d);
    printf("%.1f",c-d);
}
```

	Input	Expected	Got	
	10 4 4.0 2.0	14 6 6.0 2.0	14 6 6.0 2.0	
	20 8 8.0 4.0	28 12 12.0 4.0	28 12 12.0 4.0	

Passed all tests!
